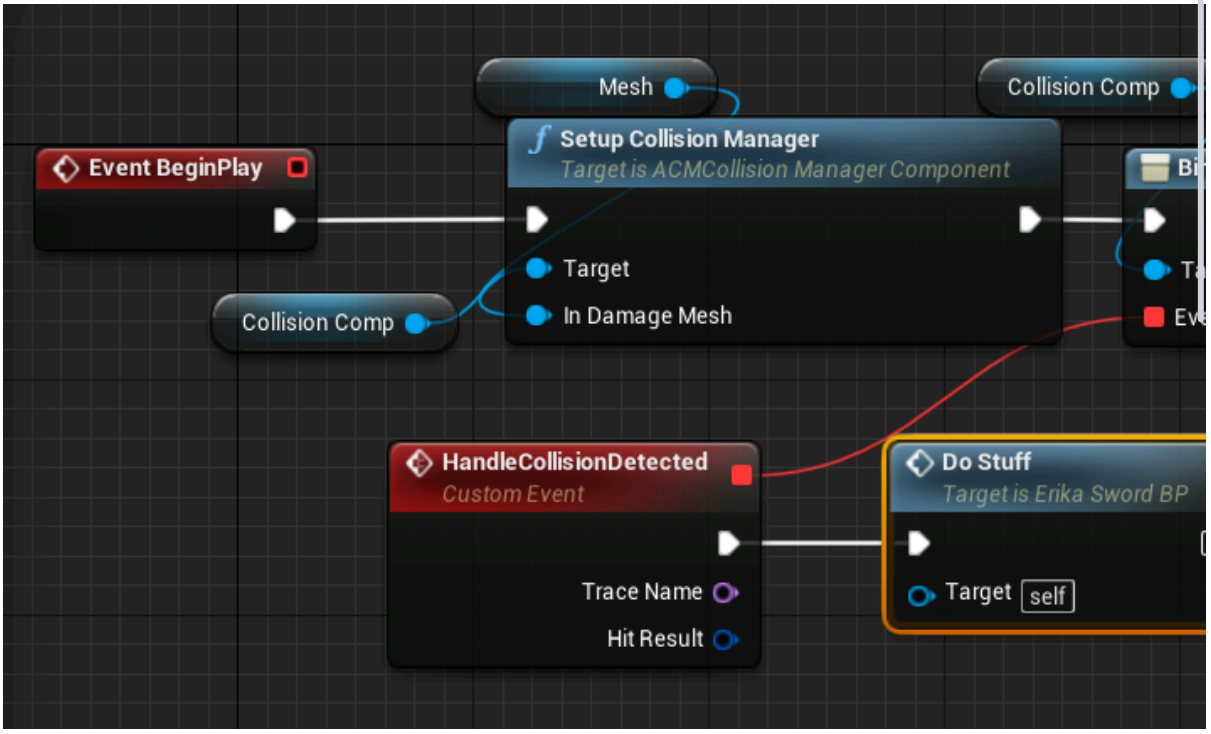
Collisions Manager

Collisions Manager Component

Combat Collisions Manager is the Plugin that manages collisions during combat. It is pretty generic and in ACF is used multiple time for both character, weapons and projectiles. The only thing to do is to configure and activate it when needed. First of all you need to add the *ACMCollisionMasterComponent* to your GameMode. This will be the responsible of all the collisions check.

Setting up your damage zones

To start using ACM you need to add the Collision Manager Component to the actor you want to deal damage and configure it:



Here an example of a Blueprint that configure the component to call DoStuff when a collision is detected, while ignoring itself and using as a collision mesh the SkeletalMeshComponent called Mesh.

To properly handle damage we now have to setup damage zones on your mesh
