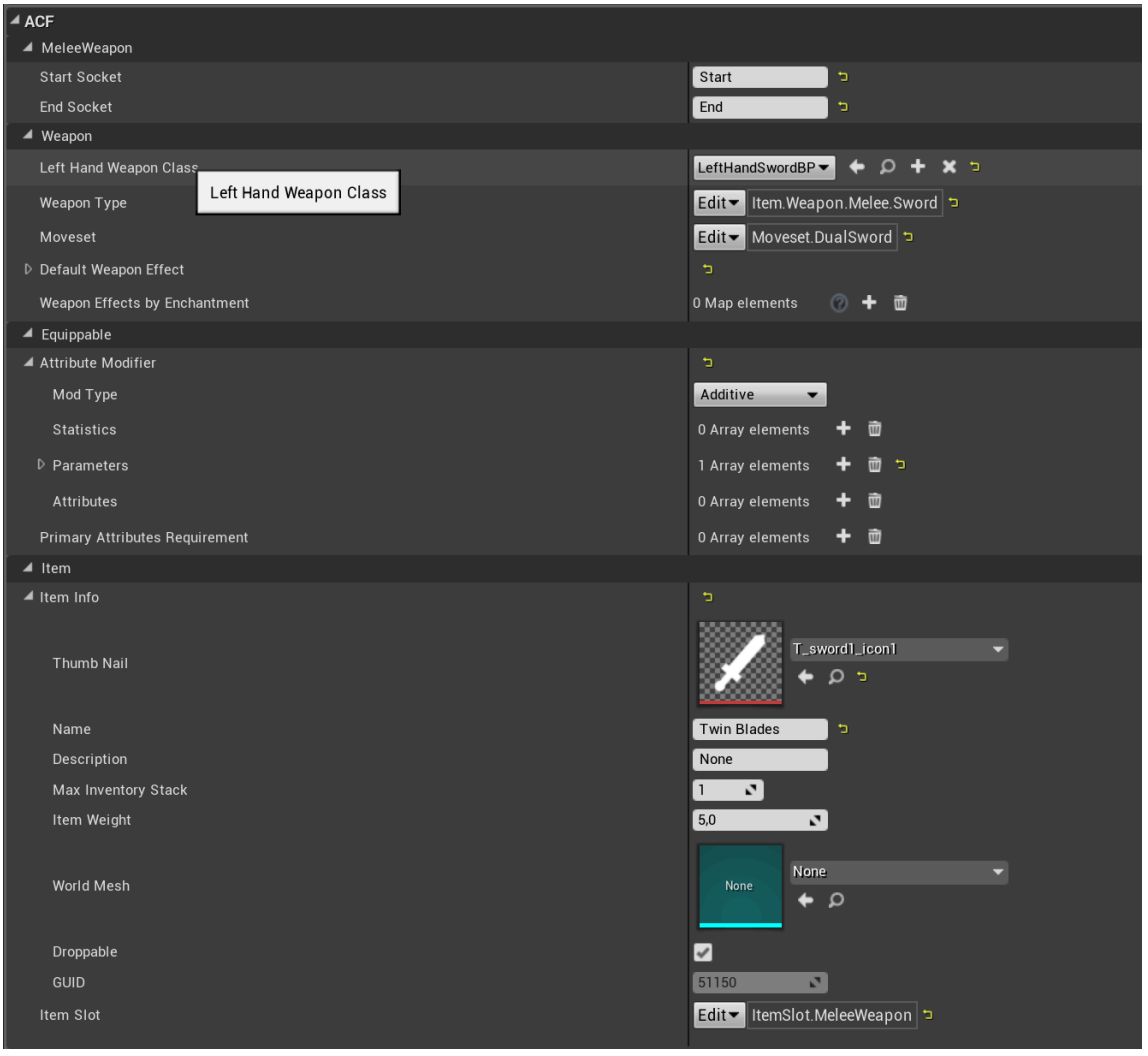
Items and Equipment

Items


The base class to refer for Items is ACFItem, every Item has a set of native properties that can be used for UI:. Items are categorized by ItemType (Weapons, Armors, Consumable, Materials) and by the slot in which they can be equipped. The ItemSlot GameplayTag is used by a character to equip it in the appropriate slot. For every character you can create as many equipment slot as you want by just adding the relative gameplayTags in the Datatable Set in Configuration as already explained in chapter 2. To make a slot available for a character you have also to add it to the *AvailableItemsSlot*. For the blueprint functions look at the *ACFDocuItem*.
