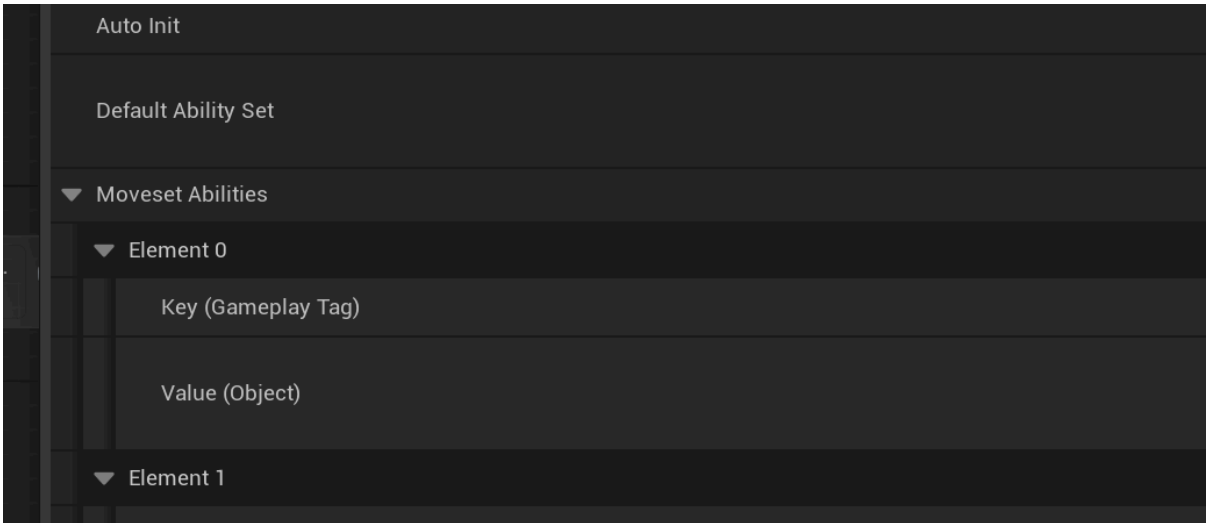
NEW V4 - ACF Ability System

The **ACF aAbility System** is one of the core gameplay pillars of ACF Ultimate. Built entirely on top of **Unreal's Gameplay Ability System (GAS)**, it provides a modular, data-driven approach to define and execute complex player and AI actions such as attacks, skills, or contextual interactions.

Each action in ACF is represented by a **Gameplay Ability** subclass (`UACFActionAbility`) that plays a montage, applies gameplay effects, and synchronizes events through replication and gameplay tags.
In short: it's a **high-level ability framework** designed for fast iteration, visual control through Blueprints, and maximum flexibility in multiplayer contexts.

Key Concepts

1. UACFAbilitySystemComponent

This component extends Unreal's standard `UAbilitySystemComponent` to handle ACF-style abilities, combo logic, buffering, and priority-based action management.


You can find it already configured in all characters within the sample project.
It provides an extensive Blueprint API for triggering and managing abilities.
