NEW V4 - Additive Layering

Additive Overlays , what they are

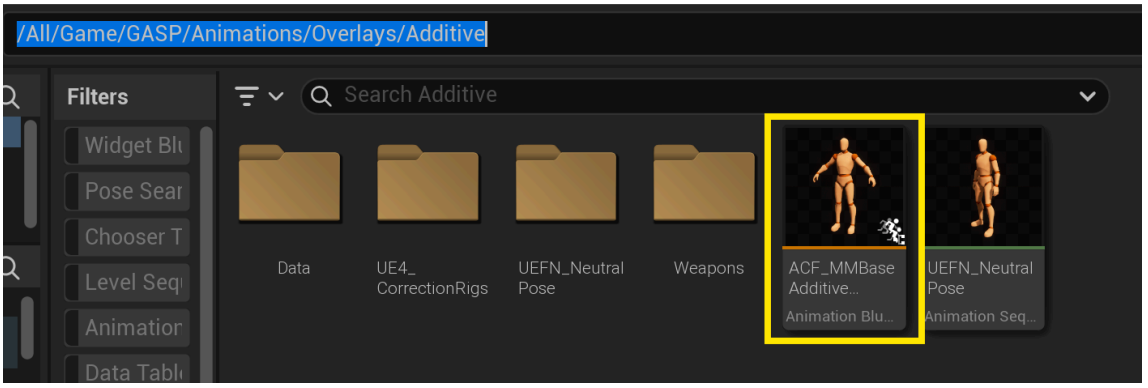
In ACF, **Overlays** are animation layers that get **blended on top of your base locomotion** (moveset), usually affecting the **upper body** (aiming, blocking, holding weapons, etc.) without swapping the whole locomotion layer. ACF keeps the “main ABP” mostly logic-only, and pushes animations into **Linked Animation Layers** that can be swapped at runtime.

In ACF v4 specifically, **OverlayLayers use GameplayTags to swap between overlay animations/layers**, so the system knows which overlay to activate depending on weapon/state.

After creating your overlay layer AnimBP, you must **assign it inside the main AnimBlueprint** (your ACF template AnimInstance) in the **GameplayTag → Overlay Layer** map, otherwise **it cannot be activated/swapped**.

Create your Custom Additive Overlay

To get started I will the primary Linked Animation Layer that drives the logic of this system is located at /All/Game/GASP/Animations/Overlays/Additive



The Rifle Linked Anim Layer is a Child of this Animation Blueprint and is located at /All/Game/GASP/Animations/Overlays/Additive/Weapons
