Save & Load System

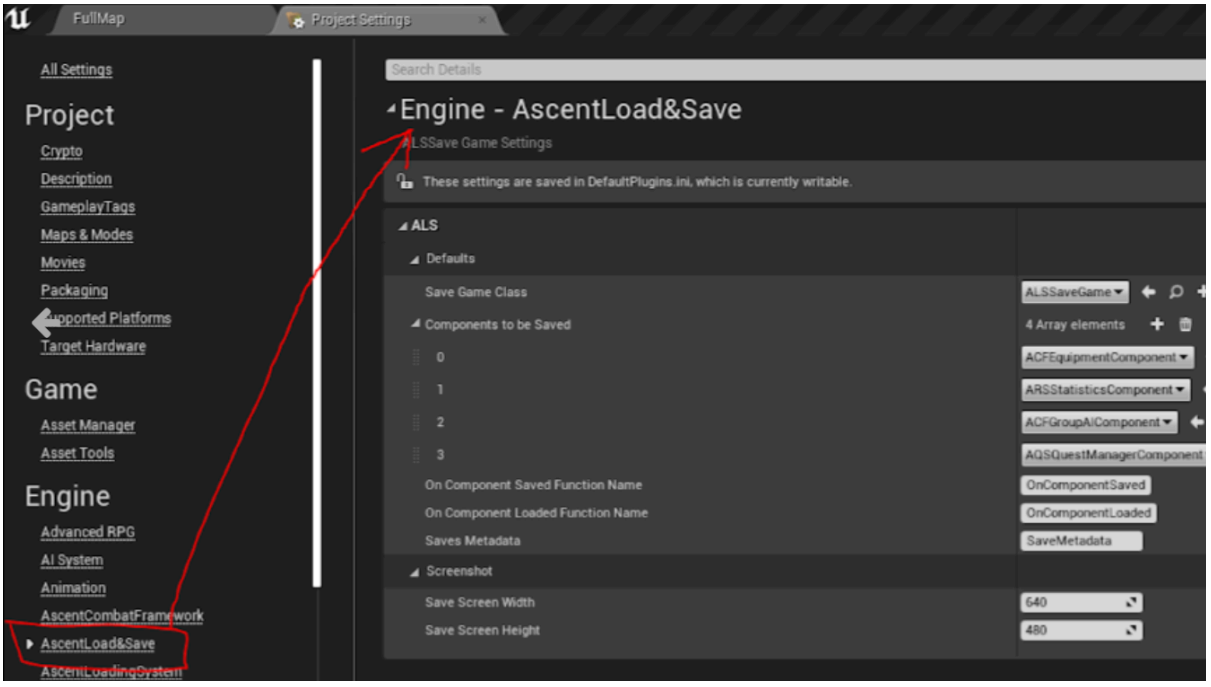
1. Ascent Loading And Save

This section describes the loading and saving behavior overall of ALS. Loading and Saving game information can be completely independent from Ascent Loading System.

1.1 Project Settings

Ascent Loading and Saving has settings that should be reviewed in each project's Project Settings (In your project go to Edit -> Project Settings).

Look for AscentLoad&Save on the left



- **Save Game Class**
  - SaveGame is a standard UE4 class that is meant to assist in identifying what is saved when a save game is triggered. If you want to include more than the basics of ALSSaveGame, create a child Blueprint of ALSSaveGame and modify as needed (I.E. you want to save a user's created Character Name, Character Customization settings if you're using a customizable character etc.), then set your class here; otherwise, stick with ALSSaveGame.
