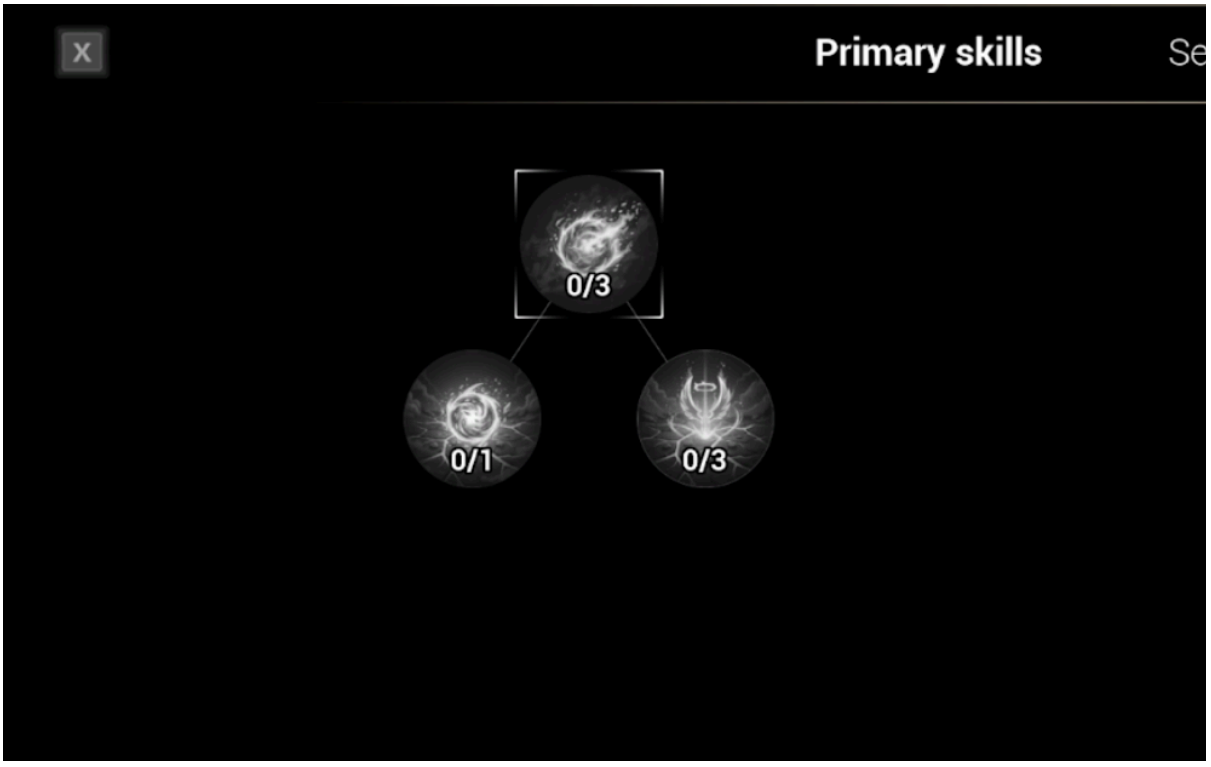
Skill Tree Creator - EXPERIMENTAL V4.2

Overview

The ACF Skill Tree System is a modular, graph-based progression system designed to work natively with the Ability System Component (GAS).

It allows developers to create branching skill paths where players can spend points to unlock Gameplay Abilities, apply persistent Attribute Modifiers (Gameplay Effects), or trigger Gameplay Tags.

The system is fully replicated and integrated with the ACF Save System, ensuring that unlocked skills, skill levels, and remaining points are persistent across sessions.


To try the Skill System in the sample project just drop in the scene **ACF_SkillGuy_BP** blueprint and interact with him.
