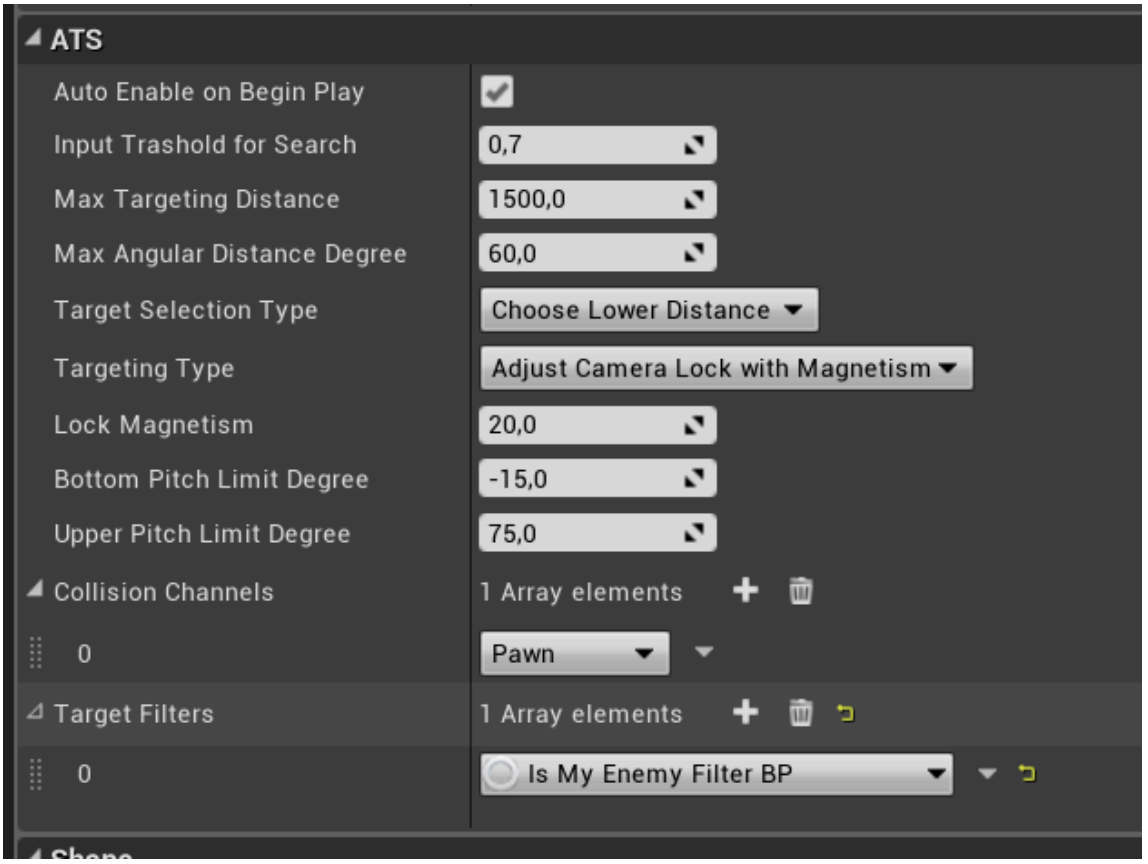
Targeting System

Basic Setup

ATS is the module used for target detection and camera locking. It is based on a highly configurable component that should be added to your PlayerController. Then to make an actor targetable it should be Implement the UATSTargetableInterface. To implement an interface, go to your Blueprint -> Class Settings -> Implements Interface -> Add and select ATSTargetableInterface. Now you need to configure the component.

Component Configuration



To trigger the targeting system you have to call the ***TriggerTargeting*** function from your component, to swap targets you have to call **Up/RightSearchTargetWithInput**.
