Ascent Combat Framework

Overview

What is ACF?

Ascent Combat Framework (ACF) is a modular C++ plugin for Unreal Engine 5 designed to provide a flexible and expandable framework for creating Action RPGs in record time. ACF combines a suite of tools and features to help developers focus on designing their unique gameplay experiences.

Why ACF is different from other assets?

ACF is like an **RPG Maker for modern games**. It is not a pre-packaged combat system with rigid, pre-defined logic. Instead, it's a **"system builder"** with a strong focus on **extensibility and customization**. While it includes a sample project for learning purposes, ACF is a **C++ framework** with a basic combat implementation (melee and ranged). It doesn't impose assumptions on yo game's design, leaving you free to expand it as you wish.
